Accelerator combined to the brake

Easy Drive R

This device combines the movement of the brake pedal by manual pushing, with electronic acceleration by **radial rotation** of the handle.
The handle is ergonomic, designed down to the smallest detail to adapt perfectly to every type of hand and not to tire the arm, even on long trip.
The result is a high-performance, intuitive product, and the acceleration thus designed is comfortable and easy to manage.

- The lever has 3 push rod selection points on the brake pedal to optimize braking effort
- The rack is made of special steel with closely spaced teeth to optimize the brake lock even with small movements while braking
- The rounded shape of the external cover allows, during use, the sliding of the knee on them, without creating continuous microtrauma to the leg.

Like the entire line of Fadiel floor levers, Easy Drive-R is equipped with a lever release mechanism which allows the lever to be unlocked by placing it on the seat, thus facilitating driving for able-bodied people.
