Light and services remote

## Light and services remote CL005

**The particular ergonomic configuration of the keyboard, the three differently coloured buttons, yellow for the left indicator and two red ones for the horn and emergency lights enable immediate acknowledgment of the functions without any risk of distraction.**

In the case of any dysfunction of an upper limb, the light and services command devices manage several of the vehicle functions (horn, indicators, lights and windscreen wipers) enabling you to continue driving in complete safety.

It is an innovative command for its small size, particular aesthetics and the various colours available and integrates perfectly with all vehicle interiors. Besides the traditional side and front management, it is possible to install the control unit detached from the knob or without the knob.

There is a charging socket and a switch on the upper part to illuminate the keyboard when driving at night.

Different finishes and colours are available: burl wood, carbon, black and grey.
