## MOTORIZED MOVIA RAMP

The motorized MOVIA ramp is a device with automatic actuation suitable for transport that facilitates access to the vehicle for people with disabilities and can also be used for loading / unloading of other vehicles and equipment such as carts for catering, hospital services, audio / light service, vending machines.

With the wide range of sizes available, the Movia Ramp can be installed on most vehicles.

### ADVANCED TECHNOLOGY

The motorized MOVIA ramps are built entirely of aluminum sheet without welding. Our production system allows the creation of lightweight devices with minimum space requirements.

The distinctive and exclusive element of the MOVIA ramps is the punching of the surface, which guarantees extreme hardness and resistance, as well as exceptional grip for trampling against water, snow and mud.

The motorized MOVIA ramp is equipped with a control panel for opening and closing and can also be supplied with a wireless system.

The ramp is equipped with two gas pistons and two comfortable handles to facilitate the opening and closing of the ramp. It is also possible to manually activate the ramp excluding automatic operation.

On request, the lights that indicate the overall dimensions are available, useful in the evening or at night. The MOVIA ramp is fixed to the vehicle floor by means of a plate with four wing nuts that make it removable. The motorized MOVIA ramp is available in opening sizes of 180, 200, 220, 240 cm and different width measurements.
